GetPhysical Master Ecosystem Specification

VERSION 3.0 — CONSOLIDATED END-TO-END BLUEPRINT B2C / REGISTRY A / B / C

0. Global Architecture & Rules

The ecosystem is built on a single, optimized Supabase/PostgreSQL schema driving real-time state via WebSockets. The B2C frontend is a React Native mobile application, utilizing a fixed bottom bar with 5 core tabs: Sodia, Discover, Cards, Track, and Profile.

Rule Domain	Implementation Protocol
Identity & Roles	Users hold one login. "Switch to Business Mode/Coach Dash" toggles UI. A "Post As" toggle dictates the publishing identity.
Security & Auth	Two-token JWT (Refresh in Secure Enclave). QR generation is zero-friction. FaceID/Biometrics required only for "Confirm & Pay".
Actionable Objects	Tags, widgets, and challenges render as tappable CTAs (Pills) that open bottom sheets. They never navigate away and persist on reposts.

Phase 1: Identity, Auth & Onboarding

Screen 1 (Splash): Checks encrypted JWT. Fresh token routes to Sodia. Stale triggers biometric prompt. No token routes to Auth. Includes force-update block and offline read-only cache state.
Screen 2 & 3 (Auth): Phone input (+63). SSO fallbacks (Apple/Google) route to phone verification for B2B deduplication. 6-box OTP verification writes to `public.profiles`.

Screen 4 & 5 (Profile): Avatar, Username (validated live). 13+ Age Gate restricts minors from payments. Home Location and Fitness Goals (multi-select pills) seed the Weighted Ranking Engine.
Screen 6 (Friends): "Sync Contacts" preceded by OS Permission Primers explaining exactly why access is needed (Location, Notifications, Camera) to reduce denial rates.

> **Financial Model: Hybrid Fee Architecture**
> Powered by Xendit xenPlatform. GetPhysical utilizes a hybrid fee model applied to the consumer checkout: a fixed P15 fee for one-time payments (e.g., Day Passes) combined with a flat 5% on recurring subscriptions to protect B2B margins.

Phase 2: Sodia (The Social Engine)

2.1 The Weighted Ranking Engine (WRE): Sodia utilizes a deterministic SQL-based algorithm (no black-box AI) to calculate relevancy based on Identity (goals), Social Graph, Tracker Exhaust (actual logged workouts), and Wallet History. "Discovery Cards" are injected every 4th or 5th slot in the chronological feed, surfacing nearby gym promos, coach bounties, or court queues.

2.2 Stories Engine: Full-screen camera with draggable Tracker Stamps and Location Tags. Location tags dynamically query the registry—Registry A tags show "Drop In", Registry B tags show "Book Court". A VIP card turnstile scan pushes an automated draft: "Checked into [Facility]. Add a quick photo?"

Phase 2.B: Verified PR Challenges & Profiles

Challenges: Users or Facilities create challenges (Lift, Move, Court) with defined metrics and dates. A "Location Lock" toggle forces the system to validate a geofence or VIP check-in during submission. Tapping "Accept Challenge" injects a Bounty Card directly into the user's Track tab (`user_bounties`).

Submissions: Video is required for Lift; GPS auto-syncs for Move. Manual tracker entries are disqualified. The system overlays an un-editable data stamp on the media, and the entry anchors a Live Leaderboard pinned in the comments.

Profiles: User profiles feature "Active Roster" badges for current gym memberships. Tabs include Feed, PRs/Entries (Trophy Case), Locker, and strictly private Albums (Before/After pics). Facility profiles display live capacity ("12/50 active").

Phase 3 & 4: Discover & The VIP Wallet

3.1 Discover Engine: A full-screen Mapbox map. Dynamic pins glow with a fire badge if the facility hosts an active Verified PR Challenge. If OS location is denied, a blur-view obscures the map, forcing a manual Zip Code entry to seed coordinates.

4.1 The 3D Wallet Stack: A vertical carousel of active passes. A single tap flips the card 180° to reveal the 60s dynamic hash QR (zero friction), automatically maximizing screen brightness.

4.2 Fitness SOA: A bottom-sheet scrolling ledger displays a unified chronological list of check-ins, payments, refunds, and expiries. Tapping any row opens detailed receipt data.

4.3 Universal Checkout: A consistent bottom sheet invoked across the app showing inventory lists, service fees, and promo fields. Requires biometric authentication to finalize.

Wallet Matrix	Logic & Database States
QR Generation	Dynamic hash of `user_id + timestamp` expiring every 60s. Verified cryptographically.
Send Action	Select pass → friend → confirm. Reassigns `owner_id` in the passes table. Writes to both ledgers.
Universal Checkout	Handles split routing. Success injects pass into stack and prompts "Share to Sodia". Never double-charges.

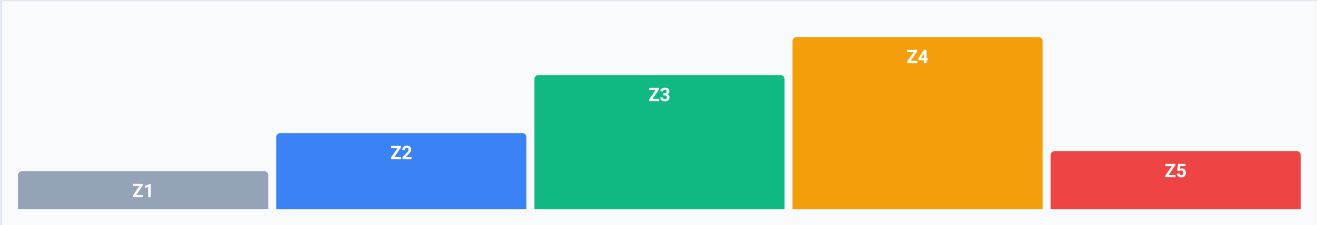

Phase 5: The Trinity Tracker (Lift, Move, Food)

5.1 Lift Tracker: Active workouts utilize an exercise block grid (sets, reps, weight). Set types include warm-up, drop, and failure. A checkmark logs the set, saves a draft for crash recovery, and triggers a floating Rest Timer (+15s/-15s). Tools include a 1RM Calculator and a Periodization Programmer (Linear or %-based over 4/8/12 weeks). Completion validates against `personal_bests` and generates a tamper-proof Lift Stamp.

5.2 Move Tracker: The Universal Selector groups Endurance, Water, Racket, Multisport, and Padel. Live mode maps GPS trails and enforces background tracking. Multisport mode swaps metrics by leg (T1/T2). Court mode prompts for Match Results. Completion displays a splits table and a Stacked Bar Chart for Heart-Rate Zones (Z1-Z5) derived from connected wearables (Apple Health, Garmin).

5.3 Food Tracker: Features a 4-macro dashboard. Logging utilizes Nutritionix NLP parsing (e.g., "2 boiled eggs and rice" splits instantly) and a barcode scanner. A NASM-powered calculator determines TDEE based on user biometrics.

> **Move Tracker: HR Zone UI Rendering (30mm SVG Target)**
>
> Post-workout summary visualizes wearable time-series data distributed across zones.

Phase 6 & 7: Settings, Safety & Moderation

Automated nudity and violence screening occurs on all media uploads. Report, Block, and Mute features are universally available. Blocking nullifies database relations and removes mutual visibility entirely. Data deletion enforces a 30-day soft delete requiring high-friction FaceID.

Anti-Cheat Logic: The system validates extreme threshold jumps. If a submitted PR lift jumps >15% over historical 1RM, the entry is automatically flagged as "Under Review" and hidden from public leaderboards pending administrative approval.

B2B Ecosystem: GymDash (Registry A)

Designed to eliminate front-desk bottlenecks, GymDash utilizes an **Append-Only Ledger**. The financial core is immutable; voids and refunds are processed exclusively as reversing entries. Identity and Cash are strictly decoupled.

- **HR Identity:** Staff clock in via mobile selfie on their personal Sodia app (geofenced). Being clocked in does not grant register access.
- **The Float Gate:** Register access demands a PIN and physical Opening Cash Float entry. Handover forces a blind count.
- **Daily Dash:** The left panel handles the Live Scanner (WebSocket bumps "Inside Now" capacity in ms). The right panel is bifurcated into *Access* (memberships) and *Store* (F&B/Merch).
- **Data Gate:** Mixed cart tendering disables app-pay, forcing unified Cash/External payment to protect platform routing.

B2B2C Ecosystem: Clubdash (Registry B)

Clubdash decouples physical real estate from community programming, serving facility owners and independent organizers.

- **Yield Management:** The system detects historical "Dead-Hours." When identified, it surfaces an action button for the owner to draft and publish an "Off-Peak SKU" directly to the Sodia consumer feed.
- **Predictive CRM:** If an Affiliate Organizer doesn't book space in 30 days, they enter the "Dormant Queue," allowing the facility to push a wholesale one-tap discount to their inbox.
- **Squatter Detection:** Checks gate scans against booked limits. If Quickdash records 14 valid scans for a court booked for 10 people, a "Capacity Breach" alert is pushed to staff.

Independent Talent: CoachDash (Registry C)

CoachDash acts as a mobile CRM and programming command line that pushes directly to the client's Sodia app.

CoachDash Logic	System Routing
Track Sync	Coach sets targets in `planned_track`. Client logs write to `actual_track`. A 3-day negative compliance delta auto-triggers a check-in message.
Agnostic Data Bank	Stores performance via JSON, allowing rendering of 1RM charts for powerlifters or pace-curves for runners from the same tables.
Affiliation Gate	A valid session booking grants dual-authorization: one QR scan clears the GymDash gate and checks the user into the Coach's ledger simultaneously.
